(57) **ABSTRACT**

Mar. 11, 2014 (AT) A50176/2014

The invention concerns a device for the hanging of textiles, such as, for example, curtains, with a holding element, which can be fastened onto a fixed structure, a counterplate securely attached onto the holding element, a pressure plate fastened in a hinged manner onto the holding element, wherein the pressure plate with the counterplate forms a clip for purposes of securing the textiles, and with an electromagnet, which operates together with an armature plate so as to close the clip. A particularly low level of noise generation can be achieved by mounting the armature plate on the holding element and coupling it by means of an adjustable connecting element with the pressure plate, and by arranging the mounting of the armature plate on the holding element between the mounting of the pressure plate and the adjustable connecting element.
