[57] **ABSTRACT**

An artificial intraocular lens device which utilizes a distendable, resilient superior loop and affixure to form a lobular positioning structure for implantation. The lens includes a superior haptic rim and large superior loop that may be secured to the haptic rim to provide spring-like lobes. In addition, various configurations of inferior loop and/or inferior haptics may be utilized in combination to provide a pseudophakia for implantation in the anterior chamber, transiridial position, or posterior chamber.
