(57) **ABSTRACT**

An automotive running board includes a base, a cover sheet, and a non-slip bar. The base is adapted to be mounted on a vehicle's lateral side and includes a top provided with at least one groove. The cover sheet is mounted on the top of the base and provided with a plurality of through-holes and a plurality of mounting holes. A plurality of support pillars is designed on a lower surface of the non-slip bar and correspondingly penetrates the through-holes of the cover sheet and resists the top of the base. A plurality of joint pillars is designed on the lower surface of the non-slip bar and correspondingly penetrates the mounting holes of the cover sheet, so that the non-slip bar securely joins the cover sheet. The running board featuring simple structure and reduced costs is easily assembled for better supportability and lowered yield loss rate.
