[57] **ABSTRACT**

A training manikin for teaching cardiopulmonary resuscitation is provided with a hollow body in human form, with two nostril orifices and a mouth orifice, and an air passage extending from the nostril and mouth orifices entirely through the interior of the body to a flushing orifice, whereby the air passage is readily flushable through the introduction of a flushing fluid into the air passage through any one of the orifices. The manikin has simulated heart, pulmonary and pulse systems, with instant readout to a separate console box.
