(57) **ABSTRACT**

A pair of sport shoe inserts may be shaped differently to provide support to different areas of the feet during movement while participating in a sporting event. The right, back corner of the right foot may be supported by a lateral flange having an inclined slope that declines inwardly and forwardly. The left, back corner of the left heel may be supported with a lateral flange having an inclined slope that declines inwardly and forwardly, but at a smaller degree than with the right heel. The right heel may have a medial area that is uncovered or unsupported, such as to allow the right ankle to roll during a swing or other movement. The left heel may have a medial area that is supported with an arch or other support that may provide for push off during a swing or other player movement.
