[57] ABSTRACT

An emollient composition, for use in a method of treating a psoriasis in which abnormal skin is exposed to actinic or ultraviolet radiation, comprising a lipophilic emollient, wherein the composition is a non-viscous liquid which, on application to skin or a like surface, spreads to provide a substantially uniform coating of the lipophilic emollient, and wherein the coating does not absorb a significant amount of the incident actinic or ultraviolet radiation and is sufficiently non-volatile to persist for a period of sufficient length, for a therapeutically effective dose of incident radiation to be administered.
