(57) **ABSTRACT**
A device for interconnecting a card including at least one first fluid channel, emerging from a connection side parallel to a support side, the interconnection device including: a first surface configured to receive the support side of the card; a second surface parallel to the first surface, from which a second fluid channel emerges; and a mechanism to hold the card in place, configured to hold a connection side of the card pressed against the second surface of the device, such that first fluid channel is in fluid connection with the second fluid channel.
