

**QUINOLINE SUBSTITUTED
NAPHTHALENEPROPIONIC ACID
DERIVATIVES AS
ANTI-INFLAMMATORY/ANTIALLERGIC
AGENTS**

This is a continuation-in-part of U.S. Ser. No. 351,119, filed May 12, 1989 now a U.S. Pat. No. 4,690,892, which is a continuation-in-part of U.S. Ser. No. 202,975, filed June 10, 1988, now abandoned, which is a continuation-in-part of U.S. Ser. No. 080,122, filed July 31, 1987, now abandoned.

This invention relates to novel naphthalenepropionic acid derivatives possessing lipoxygenase inhibitory and leukotriene antagonist activity, which are useful as anti-inflammatory, antiallergic and cytoprotective agents.

It is known that arachidonic acid (AA) is metabolized in mammals by two distinct pathways. The metabolism of arachidonic acid by cyclooxygenase enzymes results in the production of prostaglandins and thromboxanes. The physiological activity of the prostaglandins has already been amply elucidated in recent years. The other pathway of AA metabolism involves lipoxygenase enzymes and results in the production of a number of oxidative products called leukotrienes. The latter are designated by the LT nomenclature system, and the most significant products of the lipoxygenase metabolic pathway are the leukotrienes B₄, C₄, D₄ and E₄. The substance denominated slow-reacting substance of anaphylaxis (SRS-A) has been shown to consist of a mixture of sulfidopeptide leukotrienes, C₄, D₄ and E₄ [see Bach et al., *J. Immunol.*, 215, 115-118 (1980); *Biochem. Biophys. Res. Commun.*, 93, 1121-1126 (1980)].

The significance of these leukotrienes is that a great deal of evidence has been accumulated showing that leukotrienes participate in inflammatory reactions, exhibit chemotactic activities, stimulate lysosomal enzyme release and act as important factors in the immediate hypersensitivity reaction. It has been shown that LTC₄ and LTD₄ are potent bronchoconstrictors of the human bronchi [see Dahlen et al., *Nature* 288, 484-486 (1980) and Piper, *Int. Arch. Appl. Immunol.*, 76, suppl. 1, 43 (1985)] which stimulate the release of mucus from airways in vitro [Marom et al., *Am. Rev. Resp. Dis.*, 126, 449 (1982)], are potent vasodilators in skin [see Bisgaard et al., *Prostaglandins*, 23, 797 (1982)], and produce a wheal and flare response [Camp et al., *Br. J. Pharmacol.*, 80, 497 (1983)]. The nonpeptide leukotriene, LTB₄, is a powerful chemotactic factor for leukocytes [see A. S. Ford-Hutchinson, *J. Roy. Soc. Med.*, 74, 831-833 (1981)], which stimulates cell accumulation and affects vascular smooth muscle [see Bray, *Br. Med. Bull.*, 39, 249 (1983)]. The activity of leukotrienes as mediators of inflammation and hypersensitivity is extensively reviewed in Bailey and Casey, *Ann. Reports Med. Chem.*, 17, 203-217 (1982) and in Bray, *Agents and Actions*, 19, 87 (1986).

There is also evidence that products of the cyclooxygenase/lipoxygenase pathways play key roles in both the pathogenesis of gastric mucosal damage due to extracellular (gastric and intestinal contents, microorganisms, and the like) or intracellular (ischemia, viruses, etc.) agents, as well as in cytoprotection against such damage. Thus, on the one hand prostaglandins exert a cytoprotective effect on the gastric mucosa [see Robert, *Gastroenterology*, 77, 761-767 (1979)] and this action of the prostaglandins, especially of the E series, is consid-

ered to be of importance in the treatment of gastrointestinal ulceration [see Isselbacher, *Drugs*, 33 (Suppl.), 38-46 (1987)]. On the other hand, ex vivo experiments have shown that gastric mucosal tissue from ethanol-pretreated rats is capable of LTC₄ generation and that this LTC₄ production is quantitatively related to the severity of the ethanol damage [see Lange et al., *Nauyn-Schmiedeberg's Arch. Pharmacol. Suppl.*, 330, R27, (1985)]. It has also been demonstrated that LTC₄ can induce vasoconstriction in both venous and arteriolar vessels in the rat submucosa [see Whittle, *IUPHAR Ninth Int. Cong. of Pharm.*, S30-2, London, England (1984)]. This is significant since ethanol-induced lesion formation in gastric mucosa may be multifactorial with, for example, stasis of gastric blood flow contributing significantly to the development of the hemorrhagic necrotic aspects of the tissue injury [see Guth et al., *Gastroenterology*, 87, 1083-90 (1984)]. Moreover, in the anesthetized cat, exogenous LTD₄ evokes both increased pepsin secretion and decreased transgastric potential [Pendleton et al., *Eur. J. Pharmacol.*, 125, 297-99 (1986)]. A particularly significant recent finding in this regard is that 5-lipoxygenase inhibitors and some leukotriene antagonists protect the gastric mucosa against lesions induced by the oral or parenteral administration of most nonsteroidal antiinflammatory drugs [see Rainsford, *Agents and Actions*, 21, 316-19 (1987)]. Accordingly, a significant body of evidence implicates the involvement of lipoxygenase products in the development of pathological features associated with gastric mucosal lesions, such as for example those induced by ethanol exposure and administration of nonsteroidal anti-inflammatory drugs. Thus, compounds which inhibit the biological effects of leukotrienes and/or which control the biosynthesis of these substances, as by inhibiting 5-lipoxygenase, are considered to be of value as cytoprotective agents.

Accordingly, the biological activity of the leukotrienes and SRS's, and of lipoxygenase as the enzyme leading to the metabolism of AA to leukotrienes, indicates that a rational approach to drug therapy to prevent, remove or ameliorate the symptoms of allergies, anaphylaxis, asthma and inflammation and for gastric cytoprotection must focus on either blocking the release of mediators of these conditions or antagonizing their effects. Thus compounds, which inhibit the biological effects of the leukotrienes and SRS's and/or which control the biosynthesis of these substances, as by inhibiting lipoxygenase, are considered to be of value in treating such conditions as allergic bronchial asthma, allergic rhinitis, as well as in other immediate hypersensitivity reactions and in providing gastric cytoprotection.

It has now been found that certain novel naphthalenepropionic acid derivatives inhibit lipoxygenase and antagonize products of the lipoxygenase pathway, and so are useful as anti-inflammatory, anti-allergic and cytoprotective agents. The present invention provides novel compounds having the following formula:
