(57) **ABSTRACT**

A bottle body structure includes a substrate accommodating a container bottle which includes an inner bottle body, an outer container bottle and a bottle cap. The bottle cap can be accommodated inside the outer bottle body and the side wall of the bottle cap is provided with a discharge hole. An ejecting mechanism, enabling the inner bottle body to displace axially relative to the outer bottle body to expose the discharge hole out of the outer bottle body, is provided between the inner bottle body and the substrate. As a result, the bottle body structure conceals the discharge hole in the outer bottle body and the ejecting mechanism enables the inner bottle body to eject automatically to expose the discharge hole, which is convenient to use and hygienic. Material in the bottle can be poured out easily with one hand. The bottle body is especially applicable to storage of spices.
