[57] ABSTRACT

The invention contemplates improved structure for use in making lens implants in ophthalmological surgery, the lens being a replacement for a cataract-clouded natural lens, and the replacement being installed in the pupil at the iris as the operative step following removal of the cataracted lens. The invention features adapter-element structure assembled or adapted for assembly to an intra-ocular lens element and having plural radially outward iris-stabilizable feet. The adapter-element structure is severably united to further material which aids in handling and storage, in readiness for later surgical use.
