(57) **ABSTRACT**

A method and system which provide for automated note completion. In one embodiment, the method is characterized by sensing a presence of a first provider; detecting at least one incomplete provider note; and presenting the at least one incomplete provider note to the first provider. In another embodiment of the method, the sensing a presence of a first provider is characterized by accepting an identifier associated with the first provider. In another embodiment of the method, the accepting an identifier associated with the first provider is characterized by accepting user input of the identifier via either a keyboard, a touch-screen reader, a graphical user interface, or a biometrics identifier. In another embodiment of the method, the detecting at least one incomplete provider note is characterized by checking at least one database for flagged-incomplete notes associated with the at least one provider. In one or more various embodiments, related systems include but are not limited to circuitry and/or programming for effecting the foregoing-referenced method embodiments; the circuitry and/or programming can be virtually any combination of hardware, software, and/or firmware configured to effect the foregoing-referenced method embodiments depending upon the design choices of the system designer.
