[57] **ABSTRACT**

An elongated hollow sleeve having a split sleeve member constructed of resilient material telescoped over one end thereof and including a plunger insertable in the other end of the sleeve. The other end of the sleeve and the plunger include coating portions for support of the tool in one hand and manipulation of the plunger for projecting the latter through the sleeve and into the sleeve member whereby a tablet or capsule frictionally supported within the split sleeve member may be ejected therefrom by the plunger when the tool has been positioned with the split sleeve member disposed in the back of the mouth of an animal to which a medicant is to be administered. In addition, the tool further includes a squeeze bulb removably engageable with the end of the sleeve remote from the sleeve member after removal of the plunger in order that the tool may also be used in the manner of an eye dropper for administering liquid medicants.
