(57) **ABSTRACT**  
The present invention relates to a receptacle which comprises  
a generally elongate tubular body, a plurality of pellets of a  
predetermined size and shape containing a predetermined  
measure of active ingredient and filtration means disposed at  
or adjacent each end of the tubular body to retain the pellets  
substantially within the body. The receptacle is sized to allow  
a carrier liquid to be drawn through it. The passage of the  
carrier liquid through the receptacle causes the pellets to  
progressively dissolve, thereby releasing the active ingredient  
into the beverage upon consumption.
