(57) **ABSTRACT**

A pet-drying device including a flexible sheet material having four openings formed therein for receiving the legs of a four-legged animal. Each opening seals around the perimeter of a pet's leg. The sheet material includes first and second longitudinally disposed edges and first and second transversely disposed edges. A first hem in the first longitudinally disposed edge receives a first drawstring for loosely tightening the sheet material around the neck and a second hem in the second longitudinally disposed edge receives a second drawstring that tightens around the tail. The first and second transversely disposed edges are secured to one another with a releasable fastener when the device is wrapped into a tubular configuration around the trunk of a pet. Warm air from a hair dryer is delivered to the inside of the sheet material through an elongate hose that engages a large diameter opening formed in the sheet material.
